Comment: This post has been in the works for a while. I originally built it with the intention of posting it on Reddit (I had no idea about the huge interest in Data Visualization out there) but once I saw the response on the DA subreddit, I decided to blog it as well. Please enjoy, and if you can spare the time, please leave a comment! Most Important Digits in the World as of 2017: Realtime Real-Time Data Visualizations I was out of town for a while, and I had to re-upload the data. I've made some minor modifications since then (added the new country flag, etc), but this is the same data as before. I only included the top 10 countries for each of the world's most important digits, so that this chart is still pretty limited. There are many more countries out there with important digits, but this is a good start. The data is a combination of Wikipedia, CIA, World Fact Book, and UN data. If you'd like to see the raw data for all of the top 10 countries, including the top country with each digit (Egypt), please see the CSV at the bottom of the post. (More) Realtime Data Visualizations These are visualizations I made in Processing using data from Wikipedia. The first two charts show the global and European average male height, and the last three charts show average

male height in the world's most populous countries. The first chart includes UN data from 2013. The UN gender imbalance data includes the percentage of men, women, and total population that is male or female. There is also a more sophisticated version of the third chart (well, more sophisticated for me, anyway) that uses regional data instead of just the total population. The final chart includes UN population data from 2013 and 2014, and the other two charts also use UN data from those years. World Population One of the world's most important digits is also the most populous world, at nearly 7.6 billion people. The world's population has actually declined in the past two years, but not by much: China, which has about 1.38 billion people, has already surpassed the US to become the world's most populous country. India, with about 1.31 billion people, is also close behind. As of 2014, the entire world's population was about 7.5 billion people, and the UN's predicted world population in 82157476af
